# How the problem looks like?

- <https://twitter.com/Hellchick/status/942863353403150336>

# What is the problem

- The ways in which FB selects information to be presented to individual users are not well understood.

# What is the problem

- The ways in which FB selects information to be presented to individual users are not well understood.
- Algorithms are like social policies; they should be available for public scrutiny

# What is the problem

- The ways in which FB selects information to be presented to individual users are not well understood.
- Algorithms are like social policies; they should be available for public scrutiny
- Users has been used as rats lab in psychological and social experiments.

## Mark Zuckerberg: 'Optimistic' AI tools to flag, remove hate speech on Facebook will be developed in 5-10 years

by Melissa Quinn | April 10, 2018 03:51 PM

- Among all the algorithms crossing our life, Facebook's coordinate how people perceive the reality; besides the enormous audience, it is personalized, making it even harder to scrutiny.

# Methodology

- We created 6 avatar-persona, without friends

Andrea  
fa i *like* di destra

Michele  
il fascistoide

Antonietta  
mette *like* a  
sinistra

Santiago  
centro-sinistra

Britta  
Movimento 5  
Stelle

Oliviero  
non orientato!

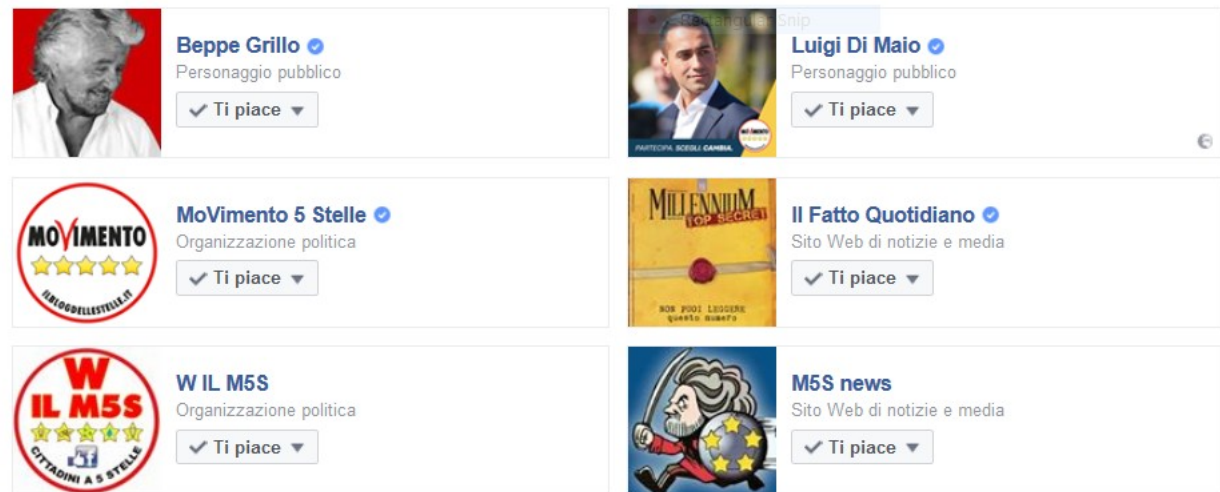

# How we made the test: political segments

- We selected 5 political orientation (center-left, right, far-right, M5S, left), 6 facebook pages for each group
- Those creates a list of 30 *sources*

# Profile orientation (train the algorithm)

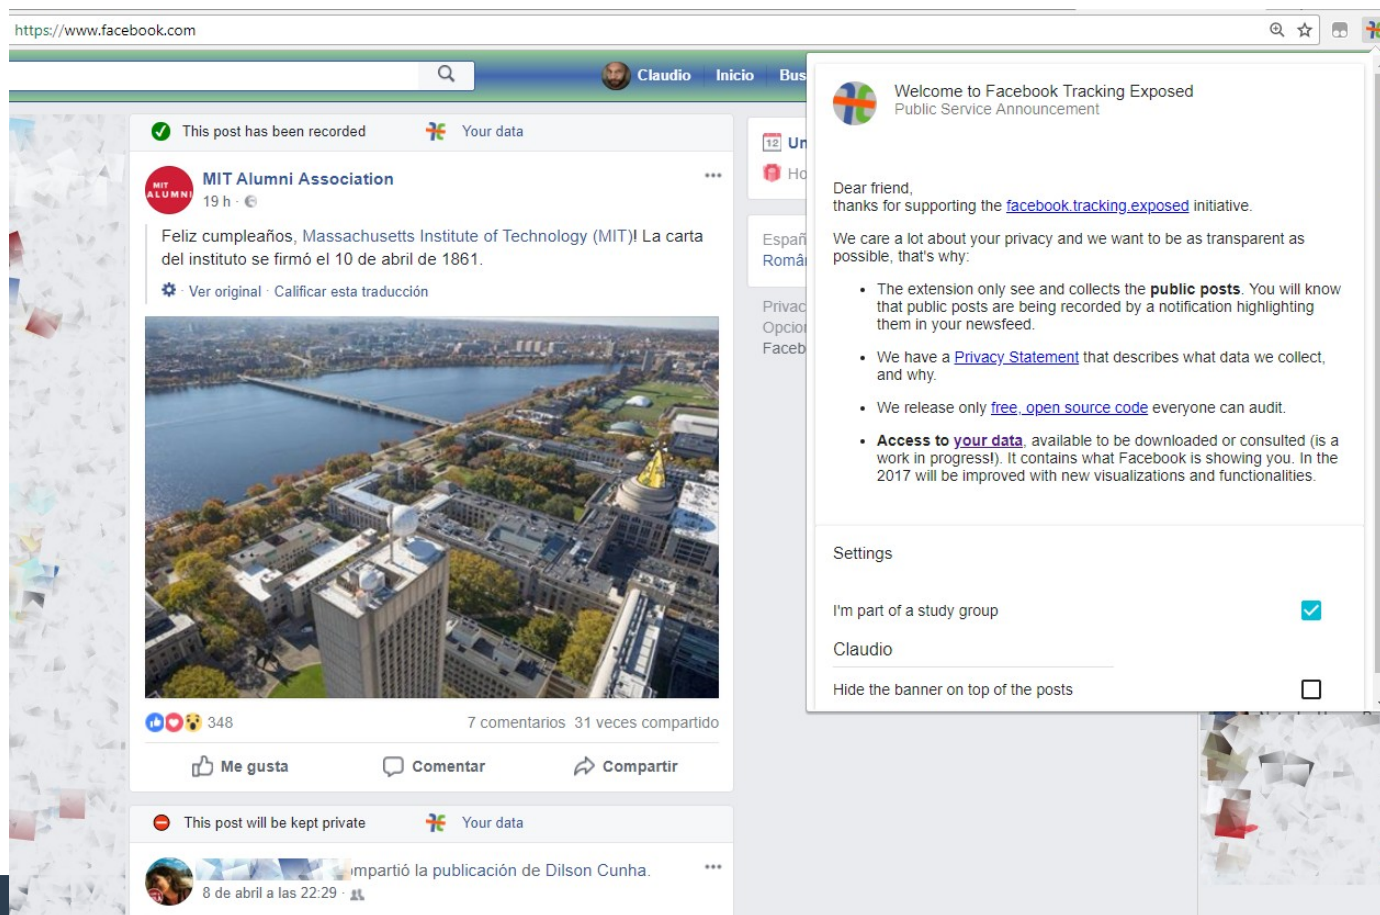

- To characterize the user, they were expressing interest on posts aligned with the political orientation

- So the algorithm starts feeding them based on their polarization

# Our approach

- Using a web-extension, we will collect data on what each user sees on their public timeline.

# How data collection works

- We collect everything the algorithm shared with the users
- every hour all the users access to facebook at the same time, the tool scrolls automatically

# Few notes on metadata

- The data+metadata you download from your Facebook are “what you gave/what FB took”
- The metadata Facebook has about you is a trade-secret
- The metadata you can take from facebook API are some, and depends from the sources
- The metadata we have are attributed from the HTML snippet we scrape.

# How an algorithm looks like?

- Produce visualizations and other renderings of how different users experience the FB algorithm.

8-14 February (diversity+type)

# How to judge algorithm fairness?

- We can't know what's the right way, because do not exists the right prioritization algorithm.

# How media are really treat?

Number of records per source between the 8th and the 14th of February

# Media and bubbles

Number of records per source between the 3th and the 11th of March

# Political candidates and bubbles

Number of records per candidates and parties between the 8th and the 14th of February

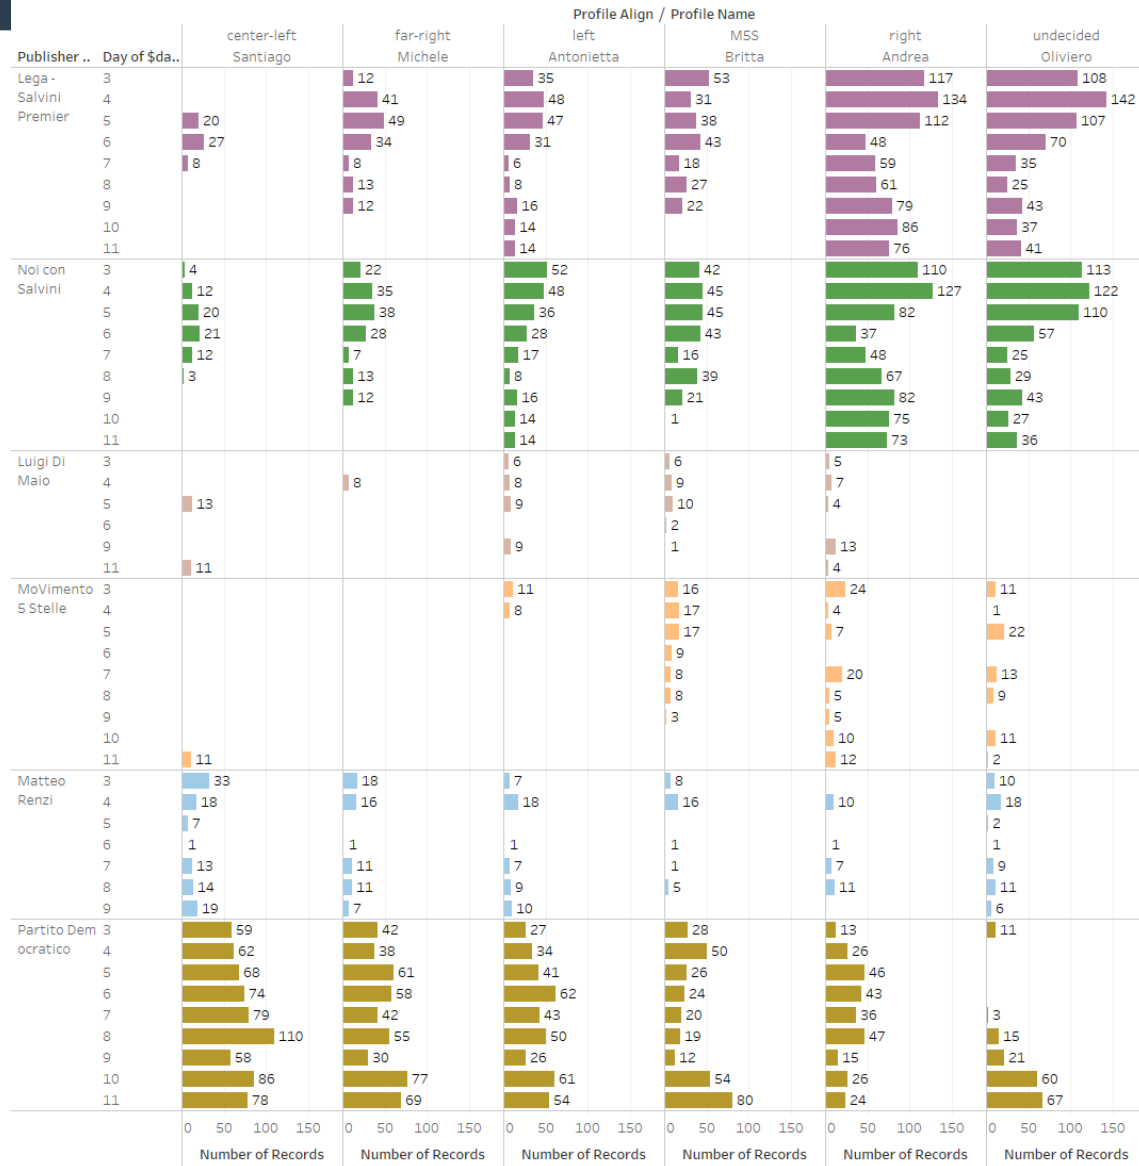

# Algorithm was changing, we took a *picture*

January 11, 2018

## Bringing People Closer Together

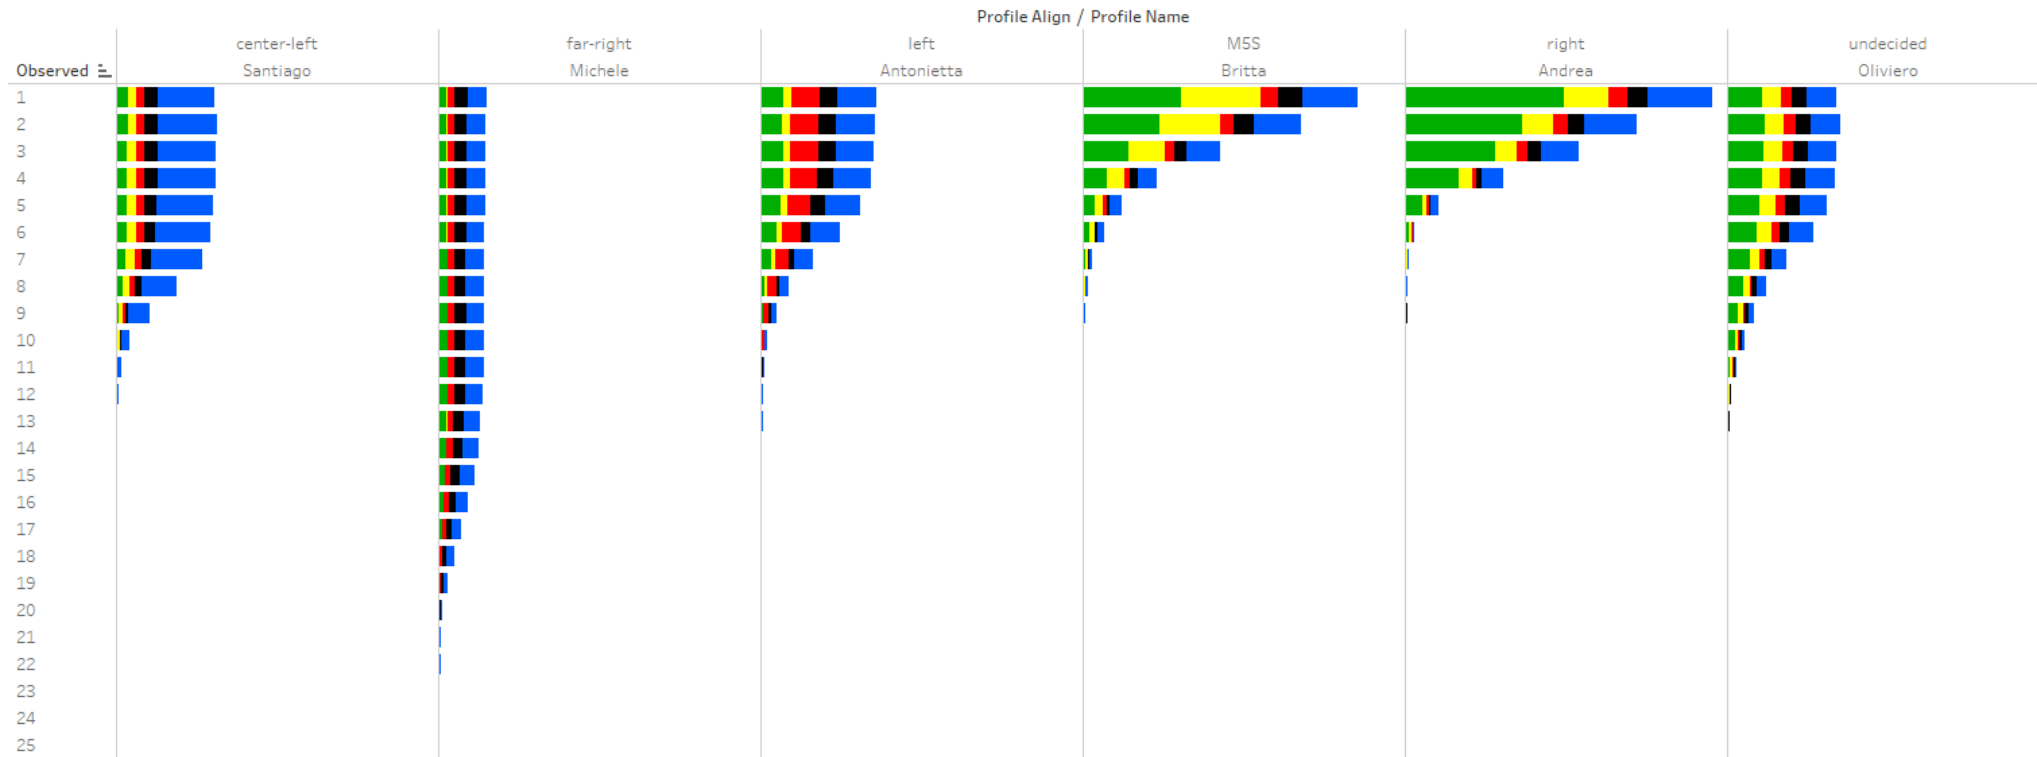

Number of records per candiates and parties between the 3th and the 11th of March

# Information diversity

19-26 February (repetition+sources)

# Information diversi

3-11 March (repetition+type)

# Race at the top

Unique contents between the top15 feeds in the timelines

# tomorrow, algorithm-driven censorship

## States, companies, algorithms and crowds: the many new faces of web censorship
